

GREEN AMAZZONITE GRANITE

"GREEN AMAZZONITE" Granite is a very new and attractive emerald green amazonite bearing granite, discovered in southern Africa few years ago.

The granite outcrops in correspondence of a ridge (old aplitic dyke), two kilometres long and 25-30 m wide, very regular in geometry, composition and texture.

It's fine grained, with elongated amazonite crystals (1 - 5 cm) along the hanging walls and with more isotropic structure in the centre. Although on surface the granite is weathered the inner rock mass is very solid and suitable for high quality production of large blocks of any size. *"GREEN AMAZZONITE" Granite*, with no particular defects, has good mechanical features and lends itself to be processed in slabs, tiles and any cut-to-size products. Some finished products, the ones coming from the more superficial and weathered area, are sometimes treated with particular resins and back-nets.

PRODUCTS

- BLOCKS of any size
- Slabs
- Calibrated tiles
- Cut-to-size products

Various finishing surfaces give the rock a very nice appearance: polished, sand-blasted, flammed and bush-hammered.
